(54) Title: BIPHENYLOXYACETIC ACID DERIVATIVES FOR THE TREATMENT OF RESPIRATORY DISEASE

WO 2007/039741 A1

## BIPHENYLOXYACETIC ACID DERIVATIVES FOR THE TREATMENT OF RESPIRATORY DISEASE

The present invention relates to substituted phenoxyacetic acids as useful pharmaceutical compounds for treating respiratory disorders, pharmaceutical compositions containing them, and processes for their preparation.

WO2004089884 and WO2004089885 disclose a series of phenoxyacetic acids that are active at the CRTh2 receptor. It has now been found that certain compounds within the generic scopes of WO2004089884 and WO2004089885, but not specifically disclosed therein, exhibit surprisingly high potency at the CRTh2 receptor together with excellent pharmacokinetic properties in animal species, and as a consequence are expected to be potentially useful for the treatment of various respiratory diseases, including asthma and COPD.

In a first aspect the invention therefore provides a compound of formula (I) or a pharmaceutically acceptable salt thereof:

Certain compounds of formula (I) are capable of existing in stereoisomeric forms. It will be understood that the invention encompasses all geometric and optical isomers of the compounds of formula (I) and mixtures thereof including racemates. Tautomers and mixtures thereof also form an aspect of the present invention.

The compound of formula (I) above may be converted to a pharmaceutically acceptable salt or solvate thereof, preferably a basic addition salt such as sodium, potassium, calcium, aluminium, lithium, magnesium, zinc, benzathine, chloroprocaine, choline, diethanolamine, ethanolamine, ethyldiamine, *tertiarybutylamine*, meglumine, tromethamine or procaine, or an acid addition salt such as a hydrochloride, hydrobromide, phosphate, acetate, fumarate, maleate, tartrate, citrate, oxalate, methanesulphonate or *p*-toluenesulphonate.

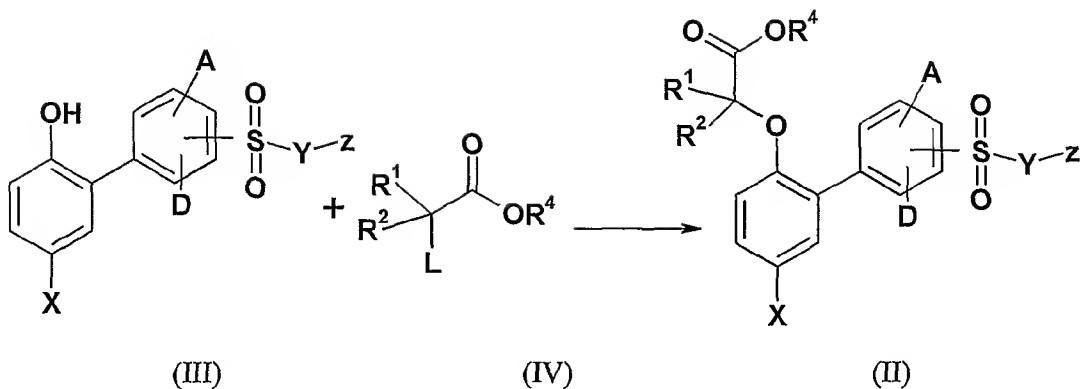

It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups in the starting reagents or intermediate compound may need to be protected by protecting groups. Thus, the preparation of the compound of formula (I) may involve, at an appropriate stage, the removal of one or more protecting groups. The protection and deprotection of functional groups is fully described in 'Protective Groups in Organic Chemistry', edited by J. W. F. McOmie, Plenum Press (1973), and 'Protective Groups in Organic Synthesis', 3rd edition, T. W. Greene & P. G. M. Wuts, Wiley-Interscience (1999).

Compounds of formula (I) can be prepared by hydrolysis of a compound of formula  
10 (II):

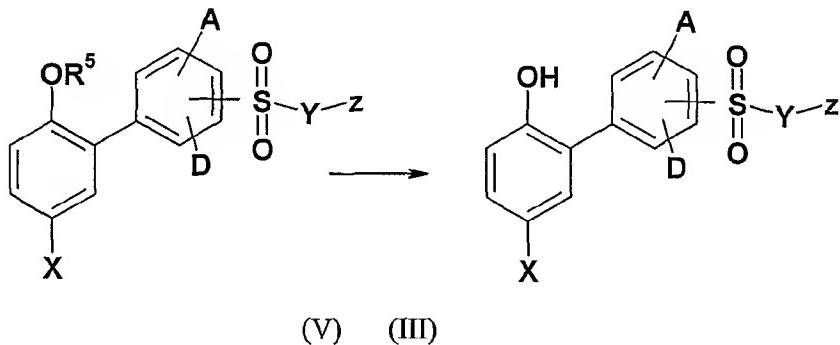

15 in which X, A, D, Y, Z, R<sup>1</sup> and R<sup>2</sup> are as defined in formula (I) or are protected derivatives. R<sup>4</sup> is C<sub>1</sub>-C<sub>10</sub> alkyl group. Suitable groups R<sup>4</sup> include methyl, ethyl or tert-butyl. Hydrolysis of the ester group R<sup>4</sup> can be carried out using routine procedures, for example treatment of methyl and ethyl esters with aqueous sodium hydroxide, and treatment of tert-butyl esters with acids such as trifluoroacetic acid.

Compounds of formula (II) can be prepared by reaction of a compound of formula (III) with a compound of formula (IV):

in which X, A, D, Y, Z, R<sup>1</sup>, R<sup>2</sup> are as defined in formula (I) or are protected derivatives. L is a suitable leaving group such as halo or an activated alcohol, in particular chlorine, bromine or tosylate. The reaction can be carried out in a suitable solvent such as acetonitrile or DMF using a base such as potassium carbonate or the like. L may also be hydroxy so that a Mitsunobu reaction may be performed with compound (II) using for example triphenylphosphine and diethyl azodicarboxylate. Compounds of formula (II) are novel and form an additional part of this invention.

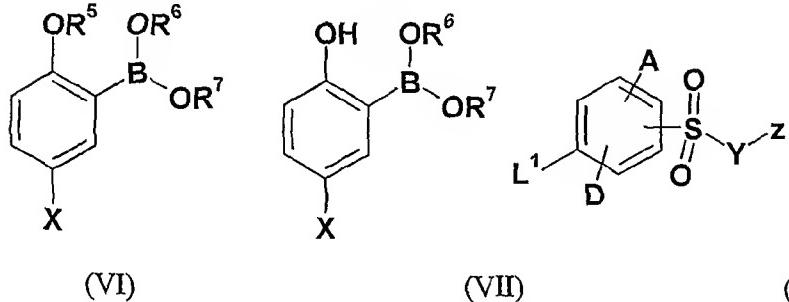

Compounds of formula (III) can be prepared by deprotection of a compound of formula (V):

in which X, A, D, Y and Z, are as defined in formula (I) or are protected derivatives. R<sup>5</sup> is a suitable protecting group, for example benzyl or C<sub>1-6</sub> alkyl, such as methyl. The protecting group R<sup>5</sup> can be removed using a suitable dealkylating agent such as BBr<sub>3</sub> in a suitable solvent such as DCM or the like. If R<sup>5</sup> is benzyl, then it can also be removed using standard hydrogenation conditions, such as palladium on charcoal in a suitable organic

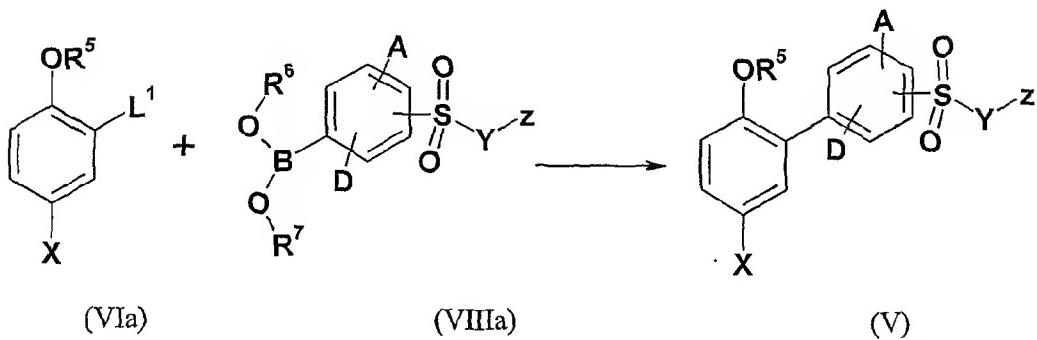

solvent under an atmosphere of hydrogen in a sealed vessel. Compounds of formula (V) are novel and form an additional part of this invention.

Compounds of formula (III) and compounds of formula (V) can be prepared by reaction of a compound of formula (VI) or a compound of formula (VII) with a compound of formula (VIII) via a Suzuki coupling reaction followed by deprotection of R<sup>5</sup>:

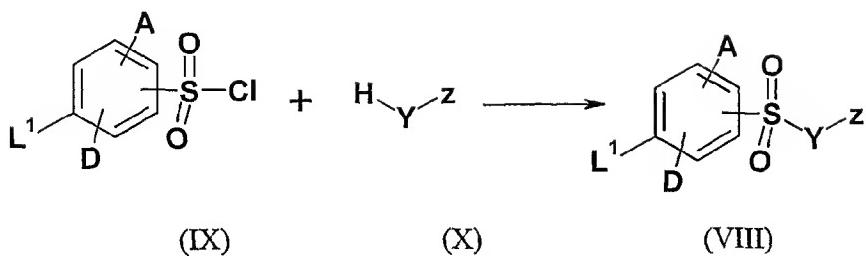

in which X, A, D, Y and Z, are as defined in formula (I) or are protected derivatives thereof, R<sup>5</sup> as defined for compounds of formula (V). L<sup>1</sup> is a suitable leaving group such as 10 halo or an activated alcohol; suitably bromo, iodo or triflate. Compounds of formula (VI) are commercially available or can be prepared as outlined previously in WO2004089884 and WO2004089885.

The above steps can also be reversed. For example, compounds of formula (V) can be prepared by reacting compounds of formula (VIIa) with a compound of formula (VIIIa) using 15 a suzuki coupling reaction followed by removal of the protecting group as outlined above.

in which X, A, D, Y and Z, are as defined in formula (I) or are protected derivatives thereof, L<sup>1</sup>, R<sup>5</sup> and R<sup>6</sup> are as outlined above.

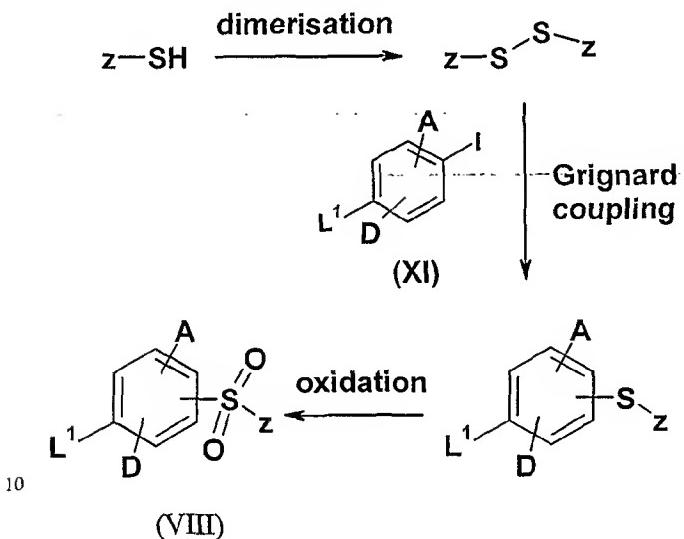

20 Compounds of formula (VIII) can be prepared by reacting compounds of formula (IX) with compounds of formula (X):

in which A, D, Y and Z, are as defined in formula (I) or are protected derivatives thereof, L<sup>1</sup>, is as outlined above.

5 The reaction can be carried out in a microwave at elevated temperatures or can be performed thermally by heating a compound of formula (IX) with a compound of formula (X) at elevated temperatures such as refluxing conditions. The reactions are carried out using a Lewis acid catalyst, such as iron (III) chloride.

Compounds of formula (VIII) can also be formed as outlined below:

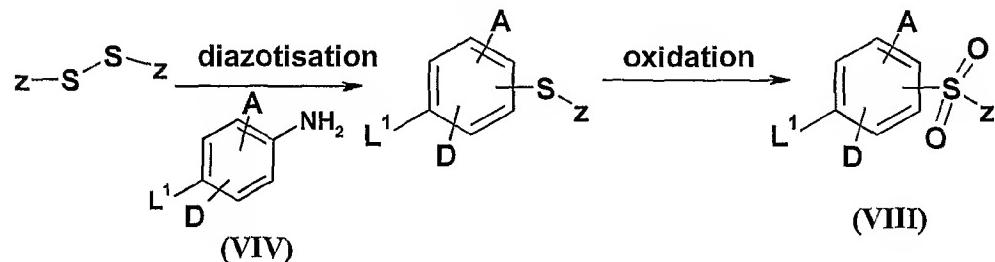

10

(VIII)

in which A, D and Z, are as defined in formula (I) or are protected derivatives thereof, L<sup>1</sup>, is a suitable leaving group as outlined above. The thiol is dimerised by reacting with sulfonyl chloride in a suitable organic solvent such as dichloromethane at low temperatures, preferably 0 °C. Alternatively the thiol is dimerised by reacting with hexamethyldisilazane and DMSO in a suitable organic solvent such as acetonitrile. The disulfide product can then be reacted with aryl halides, in particular aryl iodides compounds of formula (XI) using standard Grignard coupling conditions. The resulting sulfide can then be oxidised using standard oxidising procedures known by those skilled in the art, such as reacting with mCPBA in dichloromethane or the like.

Alternatively, compounds of formula (VIII) can also be formed from the disulfide by reaction with an aniline of formula (VIV) using diazotisation conditions, preferably using isoamyl nitrite in a suitable solvent such as acetonitrile or the like at elevated temperatures. The resulting sulfide was oxidised as outlined above.

in which A, D and Z, are as defined in formula (I) or are protected derivatives thereof, L<sup>1</sup>, is a suitable leaving group as outlined above.

Compounds of formula (VIV) are commercially available or can be readily prepared using literature procedures by those skilled in the art.

A solution of diphenyl disulphide (1.26 g) and isoamyl nitrite (1.2 ml) in dry acetonitrile (20 ml) was stirred at 50°C. 4-bromo-2,6-difluoroaniline (1.0 g) was added portionwise and the reaction mixture was stirred at 60°C for 2 h and then concentrated under reduced pressure.

15 The residue (2.1 g) was dissolved in acetic acid (7.5 ml) and hydrogen peroxide (0.7 ml, 30% in aqueous w/w) was added and the mixture stirred overnight at 100°C. Ice was added, the mixture stirred for a further 30 mins and the beige solid filtered off (0.76 g) and taken through to the next step without further purification.

**Rat Pharmacokinetic Data**15 IV and PO Rat Pharmacokinetic Studies

Test samples are made up at 1 mg/ml in an appropriate solvent and administered to Sprague Dawley rats either via the tail vein (IV, 1 ml/kg) or via the mouth (PO, 3 ml/kg).

- 18 Blood samples are removed from the tail vein (reverse side to IV administration) at a series of time points and placed on ice. Blood samples are centrifuged and the plasma removed for analysis. Plasma samples are then analysed using MS/MS and concentrations of parent compound determined from a standard curve. The plasma concentration – time plot is analysed using the commercial software WinNonLin 3.1 (Pharsight, Mountain View, CA). Pharmacokinetic parameters such as clearance, volume of distribution and half-life are determined. Compounds of formula (I) have a half life > 2.5 hours.

**Pharmacological Data**Ligand Binding Assay

$[^3\text{H}]$ PGD<sub>2</sub> was purchased from Perkin Elmer Life Sciences with a specific activity of 100-210 Ci/mmol. All other chemicals were of analytical grade.

- 30 HEK cells expressing rhCRTh2 / Gα16 were routinely maintained in DMEM containing 10% Foetal Bovine Serum (HyClone), 1mg/ml geneticin, 2mM L-glutamine and 1% non-essential amino acids. For the preparation of membranes, the adherent transfected

HEKcells were grown to confluence in two layer tissue culture factories (Fisher, catalogue number TKT-170-070E). Maximal levels of receptor expression were induced by addition of 500mM sodium butyrate for the last 18 hours of culture. The adherent cells were washed once with phosphate buffered saline (PBS, 50ml per cell factory) and detached by the addition of 5 50ml per cell factory of ice-cold membrane homogenisation buffer [20mM HEPES (pH 7.4), 0.1mM dithiothreitol, 1mM EDTA, 0.1mM phenyl methyl sulphonyl fluoride and 100µg/ml bacitracin]. Cells were pelleted by centrifugation at 220xg for 10 minutes at 4°C, re-suspended in half the original volume of fresh membrane homogenisation buffer and disrupted using a Polytron homogeniser for 2 x 20 second bursts keeping the tube in ice at all 10 times. Unbroken cells were removed by centrifugation at 220xg for 10 minutes at 4°C and the membrane fraction pelleted by centrifugation at 90000xg for 30 minutes at 4°C. The final pellet was re-suspended in 4 ml of membrane homogenisation buffer per cell factory used and the protein content determined. Membranes were stored at -80°C in suitable aliquots.

15 All assays were performed in Corning clear bottomed, white 96-well NBS plates (Fisher). Prior to assay, the HEK cells membranes containing CRTh2 were coated onto SPA PVT WGA beads (Amersham). For coating membranes were incubated with beads at typically 25µg membrane protein per mg beads at 4°C with constant agitation overnight. (The optimum coating concentrations were determined for each batch of membranes) The beads 20 were pelleted by centrifugation (800xg for 7minutes at 4°C), washed once with assay buffer (50mM HEPES pH 7.4 containing 5mM magnesium chloride) and finally re-suspended in assay buffer at a bead concentration of 10mg/ml.

Each assay contained 20µl of 6.25nM [<sup>3</sup>H]PGD<sub>2</sub>, 20µl membrane saturated SPA beads both in assay buffer and 10µl of compound solution or 13,14-dihydro-15-keto prostaglandin 25 D<sub>2</sub> (DK-PGD<sub>2</sub>, for determination of non-specific binding, Cayman chemical company). Compounds and DK-PGD<sub>2</sub> were dissolved in DMSO and diluted in the same solvent to 100x the required final concentration. Assay buffer was added to give a final concentration of 10% DMSO (compounds were now at 10x the required final concentration) and this was the solution added to the assay plate. The assay plate was incubated at room temperature for 2 30 hours and counted on a Wallac Microbeta liquid scintillation counter (1 minute per well).

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/GB2006/003697

### Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  

Although claims 18 – 20 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2.  Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple Inventions in this International application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
- No protest accompanied the payment of additional search fees.
